Map of Proposed Trans-border Jaguar Corridors Table of Contents of All Attachments

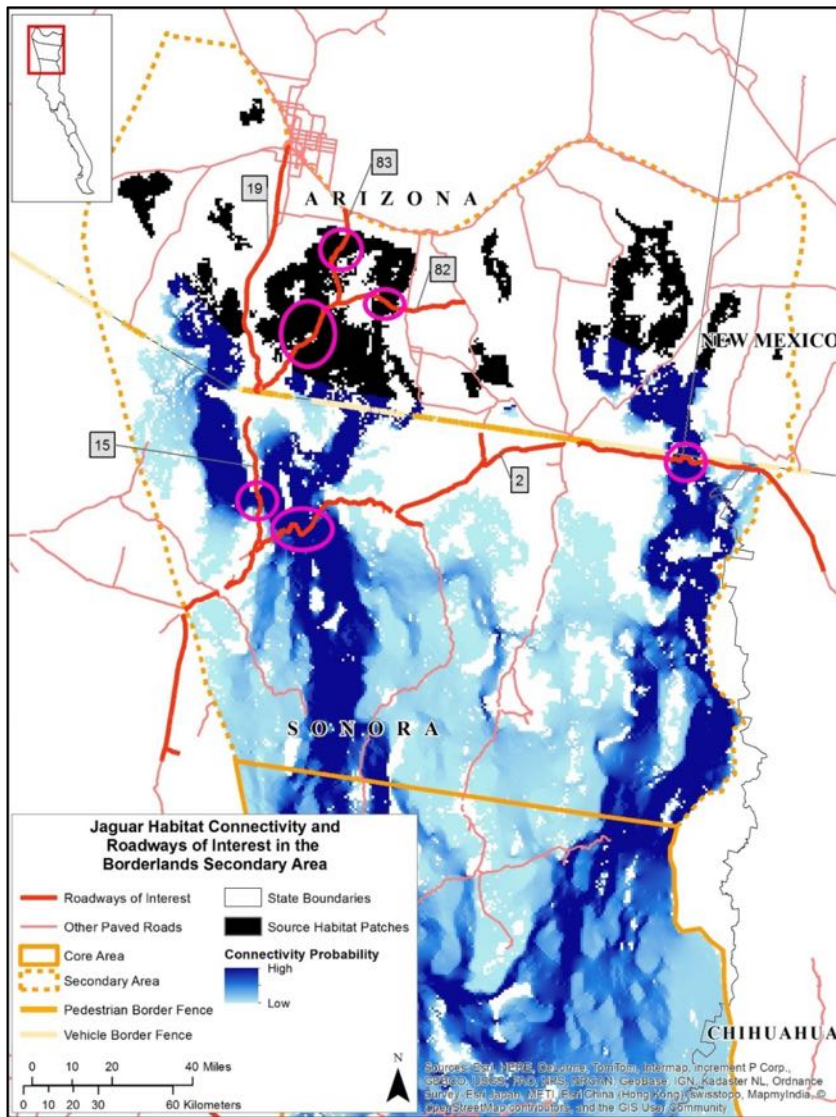

Figure 4. Map of habitat connectivity and roadways of interest in the Borderlands Secondary Area as modeled by Stoner et al. (2015) (some road segments in densely populated areas omitted). A visual examination of this connectivity model, which extends across the entirety of the Northwestern Recovery Unit, reveals three corridors that extend across the U.S.-Mexico border. These corridors are intersected by Mexico Federal Highways 2 and 15. U.S. State Routes 82 and 83 also intersect with “source” habitat patches (used for modeling purposes), which may impact jaguar habitat connectivity. These areas are good candidates for further assessment to determine the potential for road crossing mitigation structures.
